1986

INTRODUCTION

In 1983, the State Board of Health released a series of County Population Projections to the year 2020. Those projections were widely distributed and accepted for use by health agencies and others concerned with the future of our State. They were prepared as part of a long-term program of cooperative research between the State Board of Health and the Indiana University School of Business.

Often, however, planning for business or government requires information for smaller areas. Below the county level, the only geographically stable unit is the township. Historically, all other units more easily change their boundaries. To meet the need for population projections for smaller than county units, the Indiana State Board of Health, working in cooperation with the Indiana School of Business, has prepared a series of Township Population Projections. This series of township projections is offered for those who seek subcounty projections that remain consistent with the 1983 county series.

To produce these projections, representative of the State Board of Health and the I. U. School of Business conducted eighteen public meetings during April 1985. At these sessions,, preliminary projections for every township were discussed with representatives of governments, businesses, civic organizations, and interested citizens. Detailed notes were taken and tape recordings were made to ensure that local views were well understood and that the information of local experts could be incorporated into the final numbers which appear in these pages.

This series of township projections entirely replaces an earlier set produced in 1979. Work on these projections was directed by Robert A. Calhoun for the State Board of Health and Morton J. Marcus, Director of the Indiana Business Research Center at I. U. Anna Wells and Leslie Schenk developed the projections with the final figures resulting from the efforts of Michael Gann.

We believe that these projections will prove very useful to a wide variety of business investors and government agencies. We welcome any suggestions on ways to improve either the substance or the presentation of these township projections.

Any questions and/or comments about this report should be addressed to:

METHODOLOGY

The Indiana Township Population Projections are an extension of the Indiana County Population Projections, 1983 Series. These projections are for all of Indiana's 1,008 townships, and cover the period 1985 to 2020.

The model selected for these projections is a demographic model. Therefore, it assumes that the population changes within a township are the result of births, deaths, and migration into and out of the township. The model is summarized by the following equation:

the new population = the old population + births
- deaths + net migration

The population of a township was divided into cohorts classified by race (white and non-white), sex (male and female), and age (19 age categories). Projections for each cohort were computed for each five-year period from 1985 to 2020. Once projections for each cohort were computed, they were summed to produce the projected township population. After projected populations were computed for all of the townships in a county, they were adjusted so their sum was equal to the projected county population of the 1983 Series. This process provided a base projection for each township.

The assumptions made in computing the township population projections were the same as those in the 1983 Series, including:

1. Mortality rates by age, sex, race, and county will remain identical to the 1979-81 rates in the future.

2. Fertility rates by age, sex of child, race, and county will remain identical to the 1979-81 rates in the future.

3. Migration rates were based on the 1970-80 experience of the population and computed separately by race, sex, age, and county.

The migration rates were given the same profile in the future as in the 1983 Series. These were:

a. During the early years of the forecast period, cohorts with net out-migration would continue to migrate outward at the 1970-80 rates, but cohorts with net in-migration would experience reduced rates of in-migration;

b. This difference would disappear by the year 2000;

c. Both in-migration and out-migration rates would decline by the end of the projection period to a value only 1/64 of the 1980-85 rates.

At the township level, the most difficult component of the basic demographic equation was net migration. Knowledge of local conditions provided an important source of information for adjusting and projecting net migration. To obtain this information, a series of meetings was held in each of the 18 state planning areas. From these public meetings, information was obtained concerning many indicators of population change, including: housing starts and school enrollment; water and sewage conditions; availability of transportation; growing or declining industrial bases; and geographical suitability for future development.

From the extensive notes and tape recordings of these informative meetings, adjustments were made to the projected township populations to compensate for and to reflect changing conditions within the townships. An adjustment factor was incorporated into the net migration calculation. A scale, ranging from -2.0 to +2.0, was used to adjust the projected net migration. For example, if improving local conditions indicated an increase in in-migration or decrease in out-migration, then a positive adjustment factor was assigned to the township; and, if worsening conditions indicated a decrease in in-migration or an increase in out-migration beyond the base projection, then a negative factor was assigned. An adjustment factor of zero indicated net migration was not expected to change from the 1970-80 experience used in the base projection. An

adjustment factor of +1.0 corresponded, approximately, to a 10% increase in the projected population; and an adjustment factor of -1.0, a 10% decrease. Although the adjustment factors were based on the extent and number of changing local conditions, the actual assignment of magnitudes was judgemental. However, it is believed that the adjustment factors and the resulting projections are reasonable.

Finally, all county and state totals found in these projections are the same as those found in the 1983 Series.

Michael Gann
